TYPICAL CHARACTERISTICS

- a Measured without external shield in accordance with the current issue of EIA Standard RS-191.
- b With grid No.3 and grid No.2 connected, respectively, to cathode and plate at socket.
- c Conditions: $E_b = E_{C2} = 125$ V, $E_{C1} = -25$ V.
- d Conditions: $E_b = E_{C2} = 145$ V, $E_{C1} = -35$ V.
- e This value can be measured by a method involving a recurrent waveform such that the Maximum Ratings of the tube will not be exceeded.
- f Under pulse-duration condition specified in Footnote m.

- ^g Designed to mate with connector of 0.360-inch cap, generally available from your local RCA Distributor.
- ^h Designed to mate with "Novar 9-Contact" Socket generally available from your local RCA Distributor.
- ^k As defined in the current issue of EIA Standard RS-239.
- ^m This rating is applicable when the duration of the voltage pulse does not exceed 15% of one horizontal scanning cycle. In a 525-line, 30-frame system, 15% of one scanning cycle is 10 μ s.
- ⁿ In horizontal-deflection-amplifier service, a positive voltage should be applied to grid No.3 to reduce interference from "snivets", which may occur in both vhf and uhf television receivers, and to increase power output. A typical value is 30 V.
- ^p An adequate bias resistor or other means is required to protect the tube in the absence of excitation.
- ^q Total continuous or accumulated time not to exceed 40 seconds.
